

### **Problem Statement**

One of our pharmaceutical clients was having issues with code life cycle management of BusinessObjectsXIR2 system. They didn't have a repeatable code promotion process. Code promotion never worked for them.

### **Pain Points**

The code promotion cycle they were using had following pain points

- Duplicated content in the target system
- Report links broke in the target environment
- Could not promote Dashboard and Analytics
- Didn't have a mechanism to keep track of code changes

### **Solution Approach**

Our solution approach was to

- Develop, document, and implement code promotion process
- Develop, document, and implement Dashboard and Analytics promotion process
- Find out why report links were failing and fix it
- Document and implement code archiving
- Recommend developing environment independent code

### **Results**

Our consultants explained the code promotion life cycle. They were able to promote code without breaking report linking, and also able to promote dashboard and analytics. The key differentiator was to use code promotion tool rather than manual work. In the end client had a working code promotion mechanism that provided them code archiving, and promoting code without breaking any content.
